

How to write a Measurement Telnet Server

A measurement Telnet server allows you to access remote I/Os with a standard Telnet client program. The following samples shows a way to set the LEDs of a DNP/EVA2 evaluation board with a Telnet client program.

The C sample code in this document forms a measurement (MSR) Telnet server for the DNP/1110. The server allows you to enter values between 0 and 255 within a Telnet client window. This value is converted to a 8-bit binary number. The measurement Telnet server writes the binary number to the DNP/1110 parallel I/O port A. This port drives the DNP/EVA2 LED array.

- **1. Step:** Download the sample source code **msrtsvr6.c** from www.dilnetpc.com (i.e. enter the URL www.dilnetpc.com/msrtsvr6.c to your browser). The following listing shows this sample code. Please note: We have removed some text within some **printf**-statements for cutting the total length of some lines.

```
// msrtsvr6.c: Simple MSR Telnet server program. Use cross-gcc ...
// Vers. 2.00 - 24.July 2002

    fflush (stdout);

    // Send usage message to client...

    sprintf (szBuf, "\033[2J\033[H");      // Clear screen, cursor home
    send (s2, szBuf, strlen (szBuf), 0);
    sprintf (szBuf, "MSR-Telnet-Server. Vers. 1.00 ...");
    send (s2, szBuf, strlen (szBuf), 0);
    sprintf (szBuf, "Enter number 0 - 255 and press enter or ...");
    send (s2, szBuf, strlen (szBuf), 0);

    // We have a link...

link= 1;
while (link) {

    // Get next line with number or CTRL-C...

    noLine= 1;
    err= 0;
    cnt= 0;
    sprintf (szBuf, ">");
    send (s2, szBuf, strlen (szBuf), 0);
    memset (szLine, 0, sizeof (szBuf));
    while (noLine) {

        // Wait for client data...

        memset (szBuf, 0, sizeof (szBuf));
        nRet= recv (s2, szBuf, sizeof (szBuf), 0);

        // Watch the link state...

        if (nRet <= 0) {
            link= 0;                                // Disconnect by client
            noLine=0;
        }
        else {

            // Remove all char' s from szBuf...

            i= 0;
            while (nRet != 0 && noLine != 0 && link != 0) {

```

```

// If valid char: save data...

if (szBuf[i] >= 0x30 && szBuf[i] <= 0x39) {
    szLine[cnt]= szBuf[i];
    cnt++;
}
else {

    // Count invalid char' s...

    if (szBuf[i] != '\r' && szBuf[i] != 0x04)
        err++;
}

// Check for line end ('\r') or max char count...

if (szBuf[i] == '\r' || cnt > 16)
    noLine= 0;

// Check for session end (CTRL-D)...

if (szBuf[i] == 0x04) {
    link= 0;
    noLine=0;
}

// Next char...

i++;
nRet--;
}

}

// We have a new line...

if (link == 1) {

    // Check for valid number (0 - 255)...

    if (strlen (szLine) == 0 || atoi (szLine) > 255 || err != 0)
        sprintf (szBuf, "ERR\n\r");
    else {
        sprintf (szBuf, "OK\n\r");

        // Output operation: write value to port A
}

```

```

        GPCR = ((atoi (szLine)^0xff) << 8); // GPCR = 0x0000XX00
        GPSR = (atoi (szLine) << 8); // GPSR = 0x0000XX00
    }
    send (s2, szBuf, strlen (szBuf), 0);
}
}

// Close data socket...

close (s2);
}
}

```

- **2. Step:** Build a executable form the source code. Use the following listing for a makefile. With a makefile simply enter **make msrtsvr6** for build a executable.

```

CROSS      =      /usr/local/arm/2.95.2/bin/arm-linux-
CC         =      $(CROSS)gcc
CFLAGS     =      -Wall -O2 -march=armv4 -mtune=strongarm
PROJ       =      telnet

all:      $(PROJ).o
        $(CC) $(CFLAGS) -o $(PROJ) $(PROJ).o
        $(CROSS)strip $(PROJ)

clean:
        rm -f $(PROJ) $(PROJ).o

```

- **3. Step:** Transfer the executable for the measurement Telnet server from your development system to the DNP/1110. You can use a FTP session for this file transfer.
- **4. Step:** Run the measurement Telnet server on your DNP/1110. Make sure to have superuser rights. Then enter

./msrtsvr6 5000

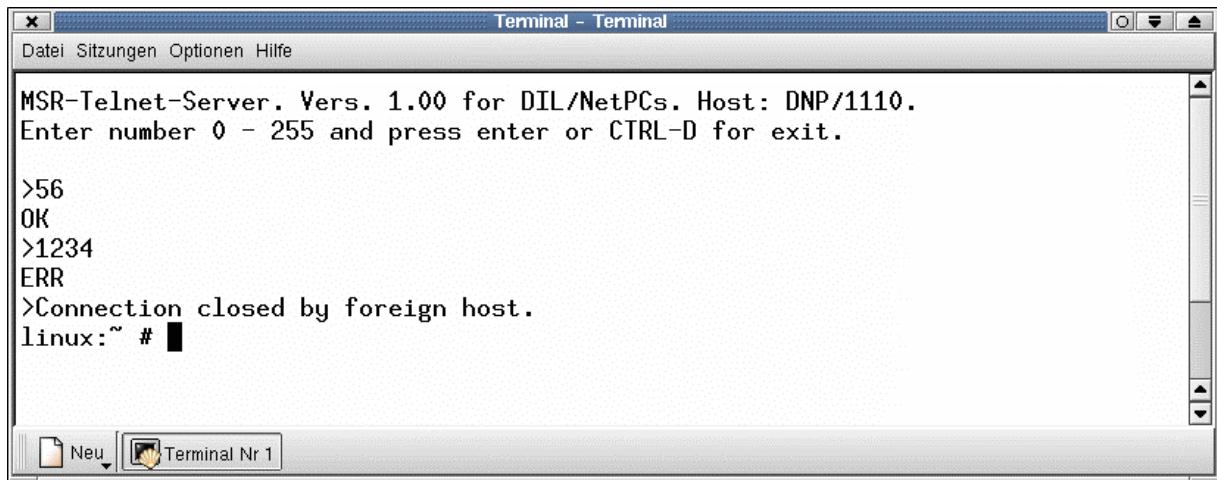

“5000” is a TCP port number. You can use any other unused port number, but not “23”. This is the standard port number for Telnet servers. Please note, that you have a other Telnet server currently running. This server is using the TCP port number 23. A good choice are port numbers over 1024.

- **5. Step:** Now you can test the measurement Telnet server. Run a new Telnet client program on your development system. Then enter

telnet 192.168.0.126 5000

within a text console window. After that a Telnet client for TCP port number 5000 starts and

builds a TCP connection. Within the new Telnet client window you see the sign-in message of the measurement Telnet server. Now you can enter valid numbers. Watch the LEDs of your DNP/EVA2 evaluation board.

For disconnect the TCP connection between the Telnet server and the Telnet client, please use the key combination CTRL-D.
