

How to build a second RAM disk for the ADNP/1486 with Linux

- **1. Step:** Make sure that you have enough free RAM space. Execute the Linux **free** command for get the current values. Typical values for a Linux 2.4.17 kernel and a root file system with GLIC 2.2 are: **Total 14.812 bytes. Used 6.464 bytes, Free 8.348 bytes.**

```

- **2. Step:** Execute the Linux **su** command for getting the superuser/administrator rights.

```
su
```

- **3. Step:** Execute the Linux **dd** command with the following parameters.

```
dd if=/dev/zero of=/dev/ram1 bs=1k count=4096
```

- **4. Step:** Execute the Linux **mkfs.minix** command with the following parameters.

```
mkfs.minix /dev/ram1
```

- **5. Step:** Execute the Linux **mount** command with the following parameters.

```
mount /dev/ram1 /mnt
```

- **6. Step:** Execute the Linux **free** command again. Now your current memory values are: **Total 14.812 bytes. Used 10.712 bytes, Free 4.100 bytes** (or something similar). The Linux **mount** commando without parameters shows the available disk drives. With the **df** command , Linux shows you the disk space.
